Sweet Shop

Web Application Testing & Bug Report

Prepared by: Md. Rahat Pervez

Submitted for: SQA Engineer Intern Assessment - RoBenDevs

Application tested: https://sweetshop.netlify.app/

Testing Approach

I went through this the way I'd normally approach testing any unfamiliar web app: click around first to get a feel for it, then go page by page more deliberately, and keep Chrome DevTools open the whole time so nothing slips past silently. Whenever something looked off, I didn't just note the symptom. I opened the Console and Network tabs to actually understand why it was happening, since that's usually more useful to a dev than just “it's broken.”

A couple of the bugs listed below are things I first flagged from reading the page's HTML source, then went back and verified by hand in the live browser. In two cases, that second check actually proved my first guess wrong, and I've kept those false leads in the appendix rather than quietly dropping them. I'd rather show the full trail than pretend every guess was right the first time.

The findings below are ordered by severity: Critical first, then High, Medium, and Low. A short section on things I checked and found working correctly follows the main list.

One more thing worth explaining upfront: the bug IDs below aren't sequential (BUG-01, BUG-02, BUG-04, BUG-06...). That's intentional, not a mistake. I logged 22 potential issues in total over the course of testing, numbered in the order I found them. Of those, 12 turned out to be real, confirmed bugs, and these are the ones detailed below. The rest were either false alarms I corrected myself after a closer look, duplicates of another bug on this list, or checks that came back clean. Those are covered in the “Additional Checks Performed” section near the end rather than getting a full write-up of their own. I kept the original numbering rather than renumbering everything 1 through 12, since that felt more honest about the actual scope of testing than quietly tidying the gaps away.

Summary of Findings

12 confirmed issues across the site, ranging from one broken image link to a login screen that doesn’t actually check passwords. Full detail on each follows this table.

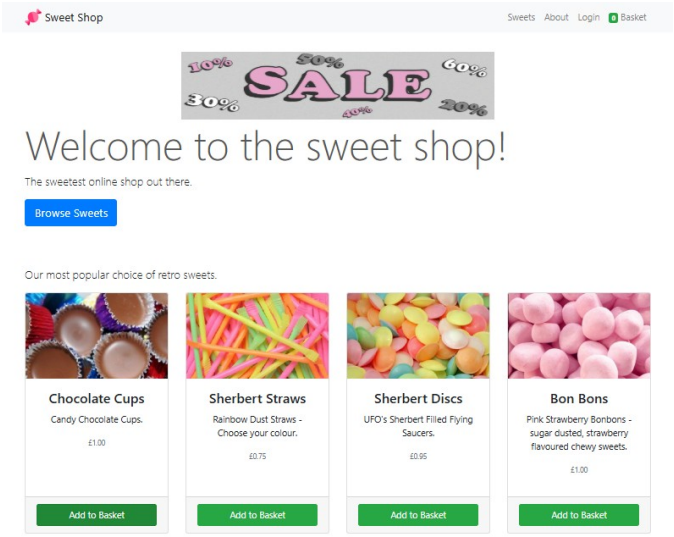

ID	Issue	Severity	Status
BUG-07	“Add to Basket” never adds anything	Critical	Confirmed
BUG-20	Login accepts any password	Critical	Confirmed
BUG-21	Order placed with empty basket	High	Confirmed
BUG-12	Payment fields accept junk data	High	Confirmed
BUG-18	No sign-up option exists	High	Confirmed
BUG-01	“About” link broken on Basket page	Medium	Confirmed
BUG-19	Wham Bars product photo is broken	Medium	Confirmed
BUG-02	Social icons go nowhere	Low	Confirmed
BUG-04	Bubble Gums image missing alt text	Low	Confirmed
BUG-06	20% Off banner only on About page	Low	Confirmed
BUG-09	Promo code gives no feedback	Low	Confirmed
BUG-22	jQuery loaded inconsistently site-wide	Low	Confirmed

Critical Issues

BUG-07: "Add to Basket" Doesn’t Actually Add Anything

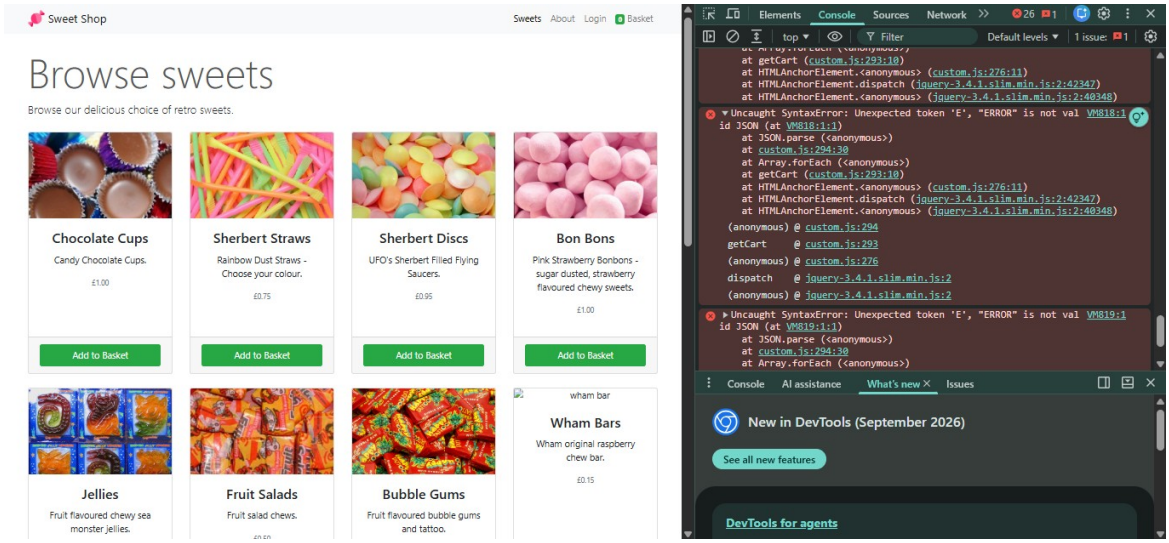

Where: Home page, Sweets page (site-wide root cause) **Severity: Critical**

This was the first thing I ran into, and it turned out to be the most serious problem on the whole site. No matter which item I clicked “Add to Basket” on, Home page or Sweets page, the basket counter in the navbar just stayed frozen at 0. I tried it on different items, different pages, clicked the same button a dozen times in a row. Nothing ever changed.

The basket stays at ‘0’ no matter how many times ‘Add to Basket’ is clicked.

Opening DevTools told the real story. Every single click throws a JavaScript error: Uncaught SyntaxError: Unexpected token 'E', "ERROR" is not valid JSON. Following the stack trace, the actual culprit is a function called getCart() inside custom.js, which tries to read the saved cart data with JSON.parse(). The value it's trying to parse turns out to literally be the string “ERROR”, not real JSON at all, so the parse call throws, the whole function crashes, and the basket state never gets a chance to update.

The console trace: getCart() crashing on JSON.parse(“ERROR”).

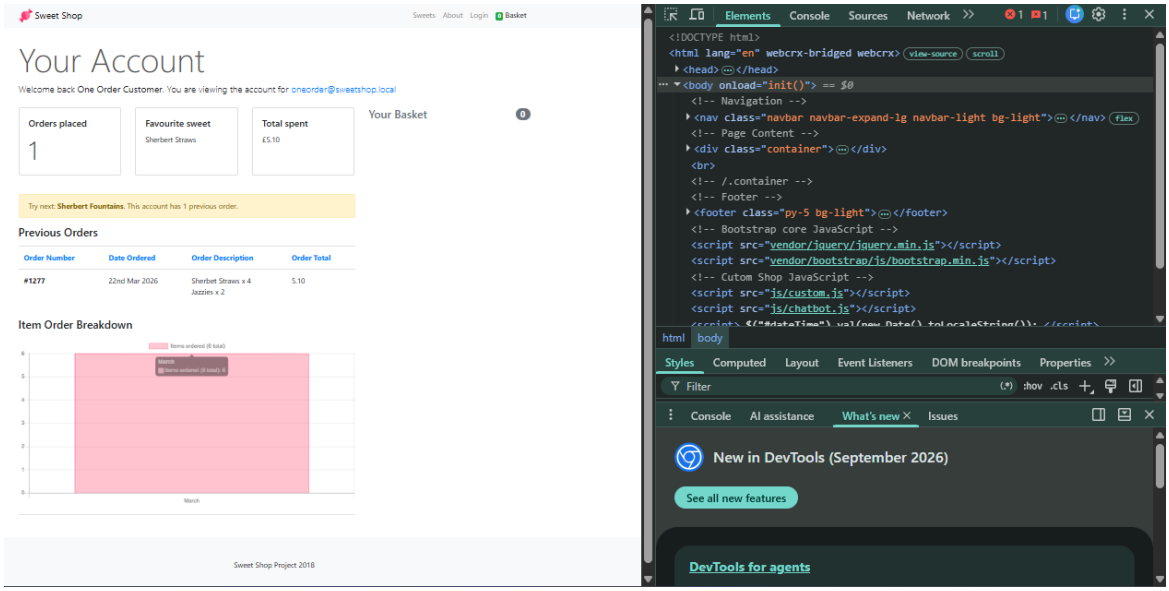

What makes this bigger than “one broken button” is that the same error also fires automatically the moment any page loads at all, since it's wired into the page's onload handler. So this isn't a button-

specific bug. It's the site's cart data itself that's corrupted, and it breaks cart initialization everywhere, not just on click.

BUG-20: Login Doesn’t Actually Check Your Password

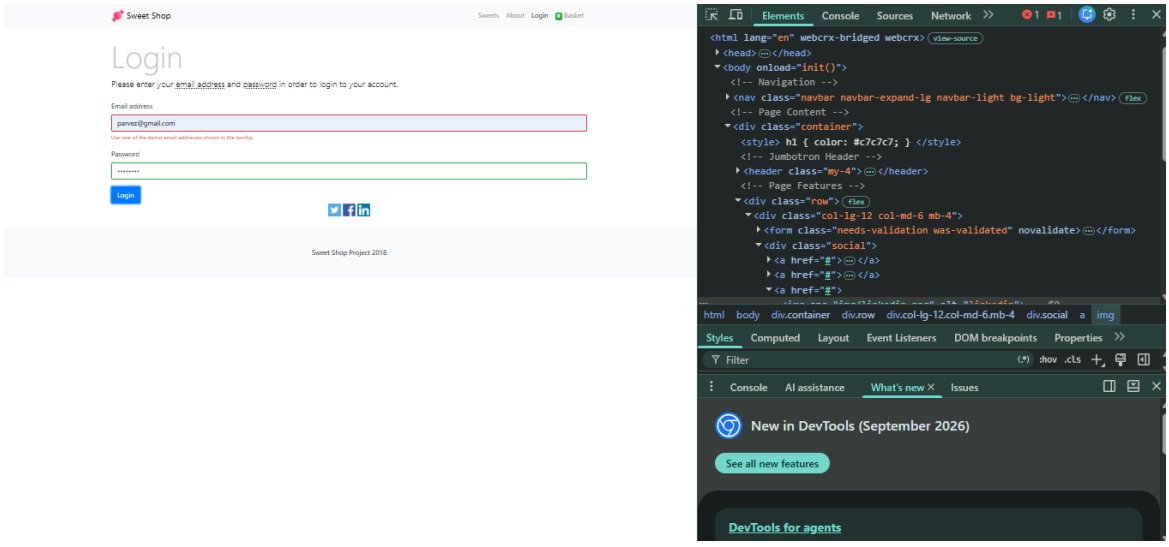

Where: Login page **Severity: Critical**

This one genuinely surprised me. The login page hands you three demo accounts to test with (oneorder@sweetshop.local, twoorders@..., fiveorders@..., all meant to use the password “qwerty”). Just to see what would happen, I logged in with a correct email but typed a completely made-up password instead, and it let me straight in. The full account page loaded, order history and everything, as if nothing was wrong.

Logged into ‘Your Account’ for oneorder@sweetshop.local, using the wrong password.

To rule out a fluke, I tried the opposite case too: an email that isn't one of the three demo accounts (I used my own Gmail address). That one was correctly rejected, with a message telling me to use one of the demo email addresses. So the form does check the email against a known list. It just never actually checks the password once the email matches. In a real production system, that would mean anyone who knows (or guesses) a valid account email could get in with literally any password.

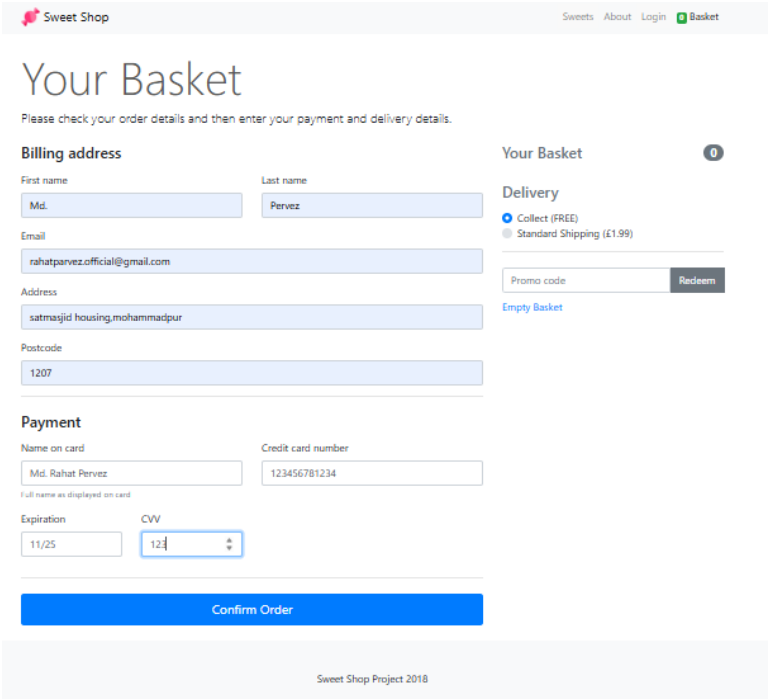

An unrecognized email is correctly rejected, confirming the email check exists, even though the password check doesn’t.

High Priority Issues

BUG-21: You Can “Place an Order” With Nothing in the Basket

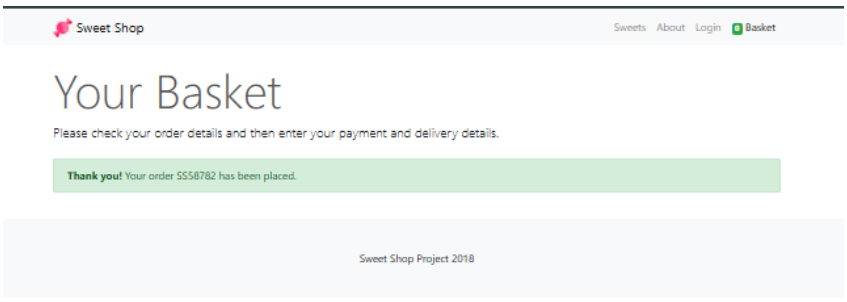

Where: Basket / Checkout **Severity: High**

Since Add to Basket never actually works (BUG-07), my basket total stayed at £0.00 through this entire round of testing. Out of curiosity more than expectation, I filled in the billing and payment form anyway and hit Confirm Order, assuming it would at least stop me, since there was nothing to actually order.

Billing and payment form filled in, basket still showing 0 items.

It didn't stop me. I got a green “Thank you! Your order has been placed” banner with a real order number. I ran this same test three separate times with different data, just to make sure it wasn't a one-off glitch, and each time a fresh order number was generated (SS58782, SS38632, SS49461). The checkout flow never verifies that the basket actually contains anything before confirming.

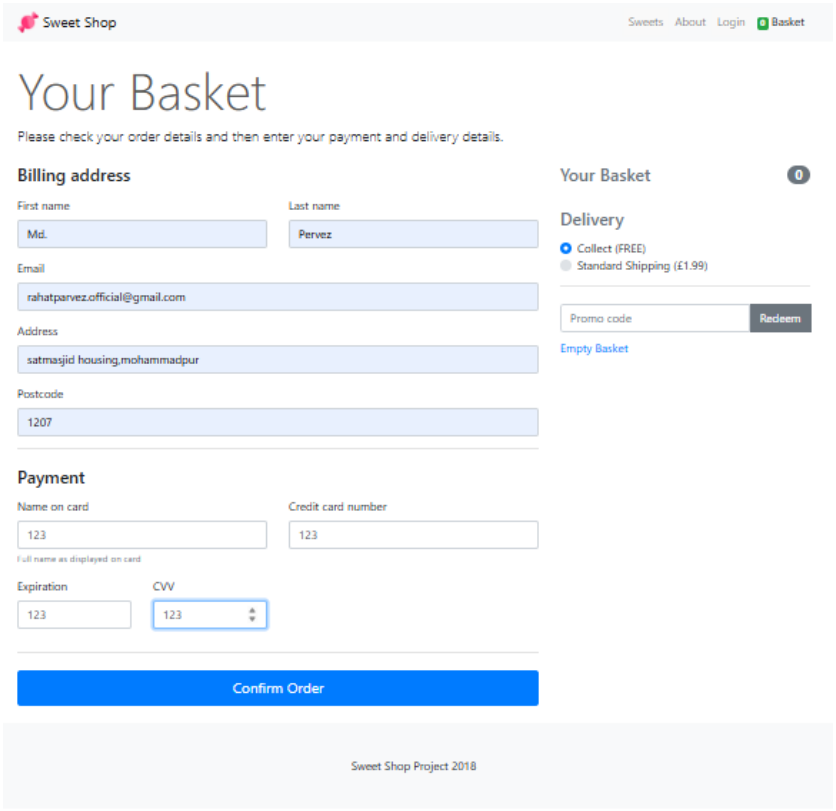

Order confirmed, despite an empty, £0.00 basket.

BUG-12: Payment Fields Don’t Validate Anything

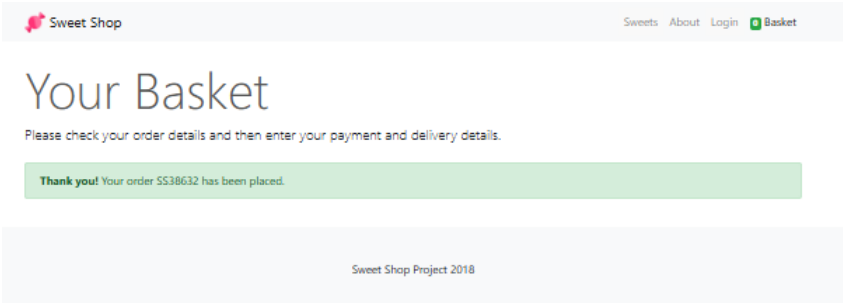

Where: Basket / Checkout **Severity: High**

While testing the checkout form further, I got curious how far the Payment section would let me push it. I typed “123” into every single field (Name on Card, Card Number, Expiration, and CVV), deliberately meaningless values that shouldn't survive any real check. The order still went through and confirmed without complaint.

'123' in every payment field: name, card number, expiration, and CVV.

There's no format or length checking anywhere in that section. A real card number should be 15-16 digits; this accepted three.

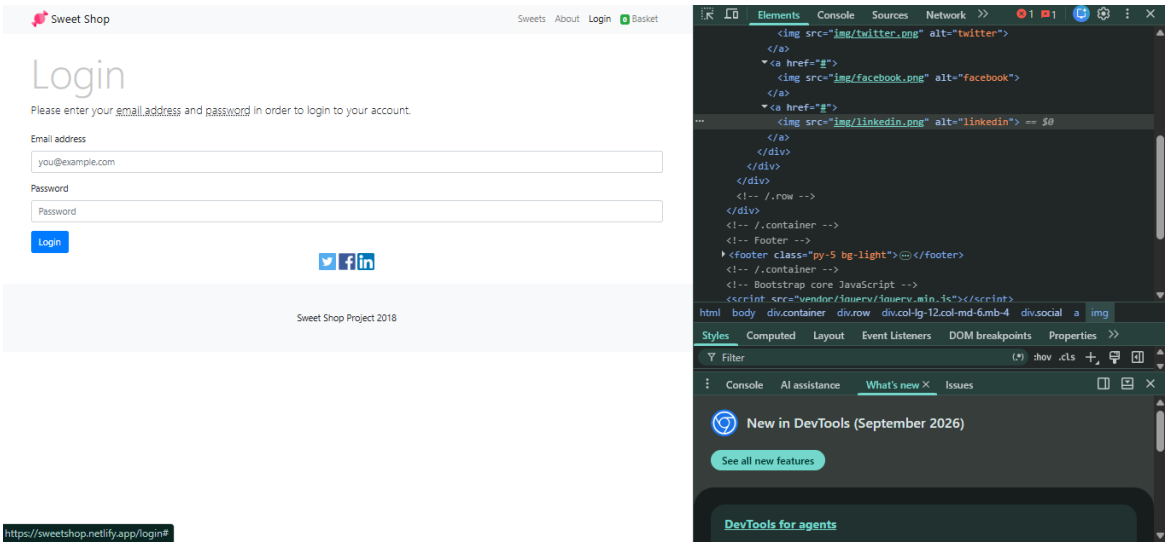

Order still confirms successfully with the junk payment data above.

BUG-18: There's No Way to Sign Up

Where: Login page **Severity: High**

I looked for a "Create Account" or "Sign Up" option everywhere it might reasonably be: the Login page itself, the main navigation, even the footer. It just isn't anywhere. The only way into the site is through the three pre-supplied demo accounts. For an actual e-commerce app, that means a genuine new customer would have no way to ever register and place an order.

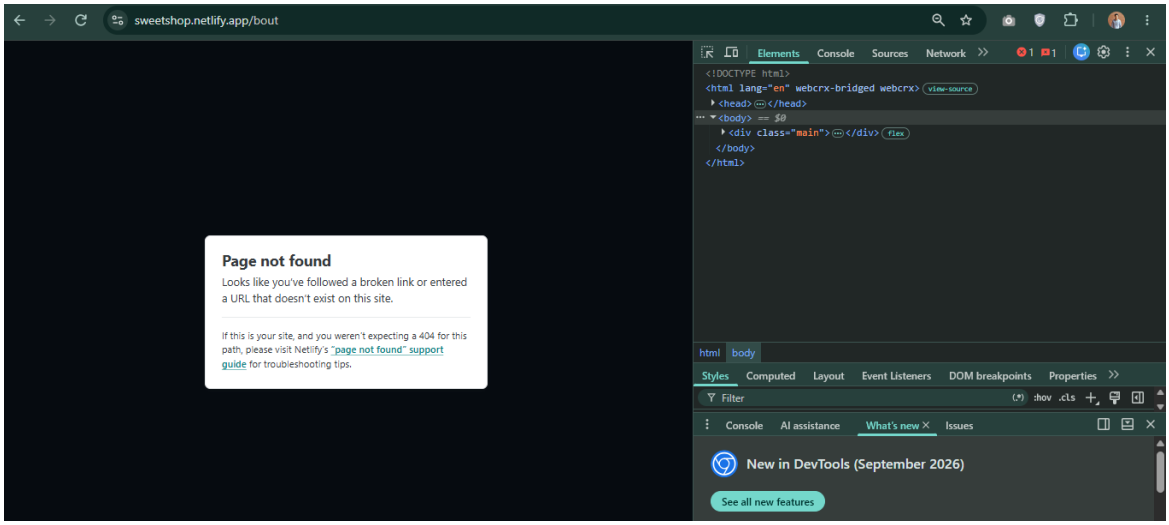

The full Login page, with no sign-up or 'create account' option anywhere on it.

Medium Priority Issues

BUG-01: The “About” Link on the Basket Page Goes to a Dead Page

Where: Basket page **Severity: Medium**

Small thing, but an easy fix. From the Basket page specifically, clicking “About” in the navbar takes you to /bout instead of /about. Someone just dropped the ‘a’. It lands on the site's generic “Page not found” screen. The About link works fine from every other page; it's just this one instance.

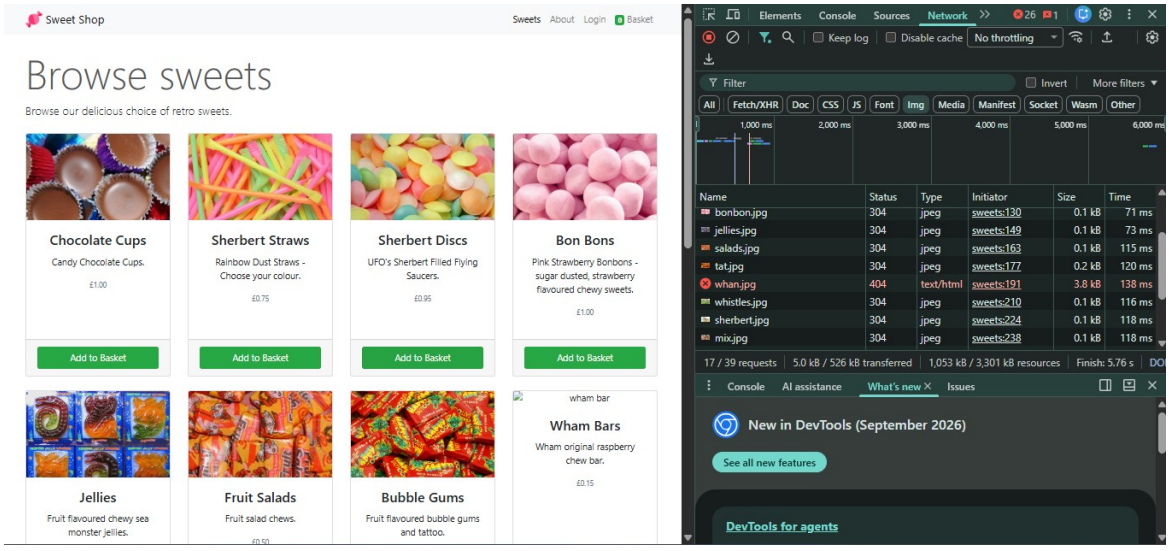

Clicking ‘About’ from the Basket page lands on /bout, a 404.

BUG-19: Wham Bars Has a Broken Product Photo

Where: Sweets page **Severity: Medium**

On the Sweets page, the Wham Bars card shows no photo at all, just the alt text “wham bar” sitting where the image should be. The Network tab confirmed it: the request for whan.jpg comes back with a 404. Looking at how the other products are named (cups.jpg, discs.jpeg, and so on), this is almost certainly just a typo in the filename; it should probably be wham.jpg.

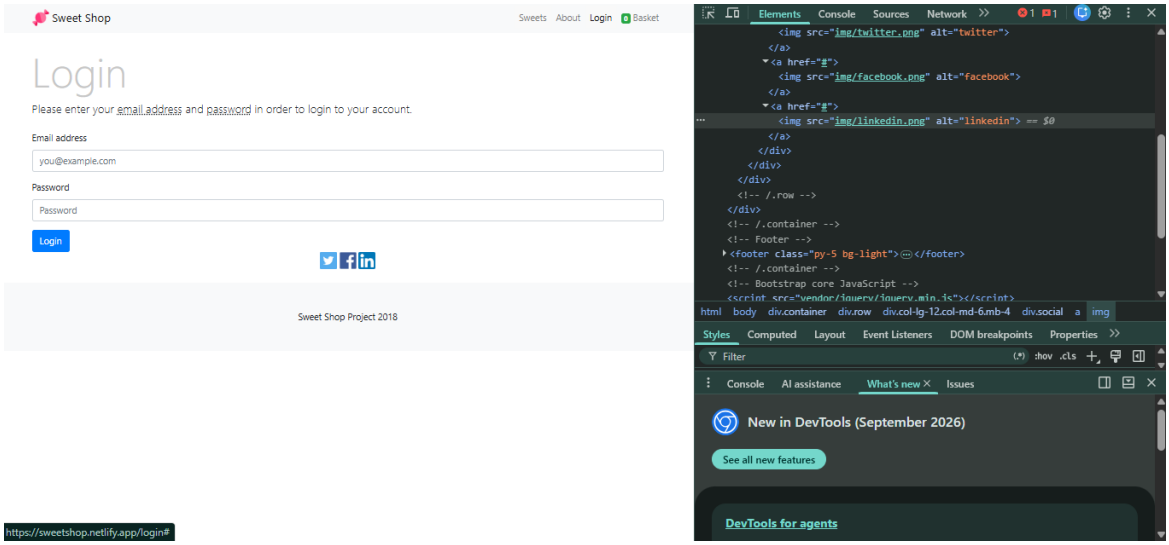

Network tab: whan.jpg returns a 404 instead of the product photo.

Low Priority Issues

BUG-02: Social Media Icons Don’t Go Anywhere

Where: Login page **Severity: Low**

The Twitter, Facebook, and LinkedIn icons on the Login page all look clickable, but none of them actually go anywhere. They're all linked to '#'. Small thing, but a real user might reasonably expect these to open something.

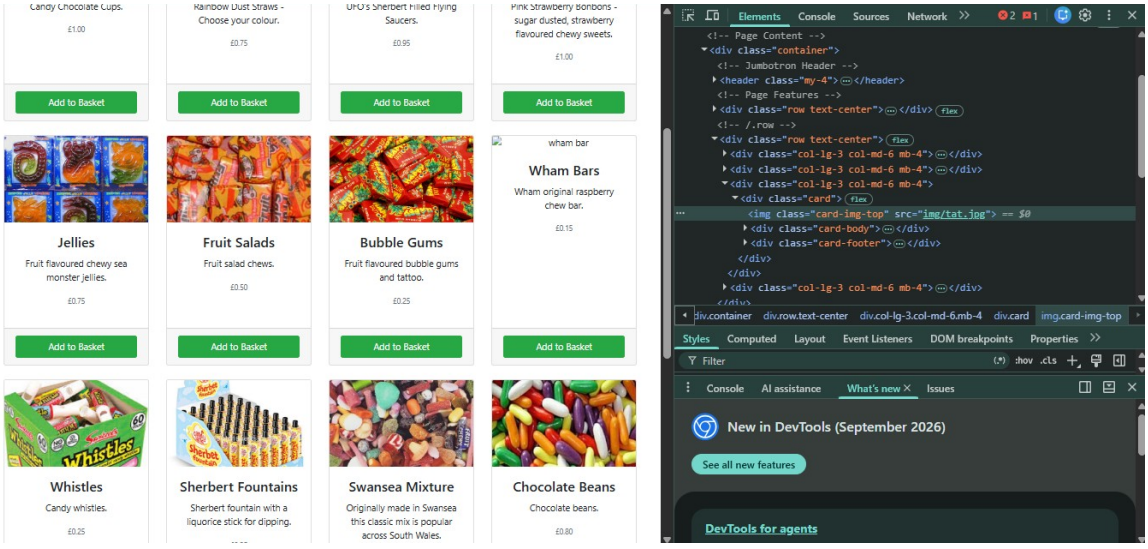

Social icons on the Login page, all pointing to ‘#’.

BUG-04: One Product Image Is Missing Alt Text

Where: Sweets page **Severity: Low**

Most of the product images have proper alt text, but the Bubble Gums photo on the Sweets page doesn't have any at all, confirmed by inspecting the element directly in DevTools. Worth mentioning honestly: I first suspected the Chocolate Cups image had the same problem, but checking it directly showed it does have alt text (“chocolate cups”), so that one was a false alarm on my part. Good reminder that a quick source read isn't the same as checking the live page.

Bubble Gums’ image element in DevTools: no alt attribute at all.

BUG-06: The “20% Off” Banner Only Shows on the About Page

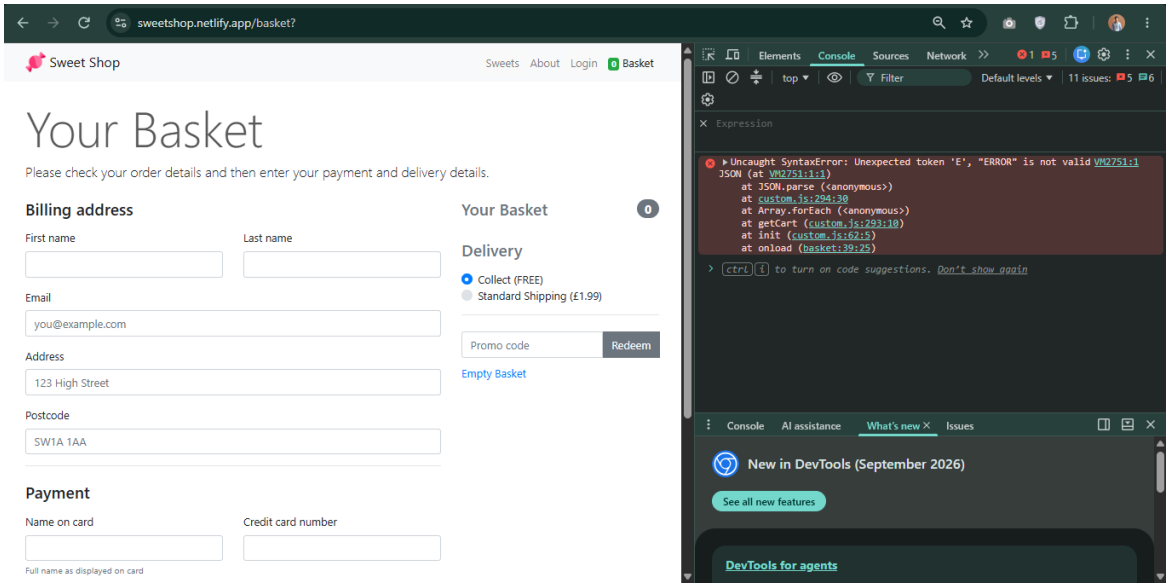

Where: About page **Severity: Low**

This felt backwards when I noticed it. The promotional banner announcing 20% off appears only on the About page, probably the page fewest visitors ever open. It's completely absent from Home and Sweets, which is exactly where it would actually get seen and might convert someone.

BUG-09: Promo Code Field Gives No Feedback

Where: Basket page **Severity: Low**

I tried the Redeem button both with the code field left empty and with a made-up code ("TEST123"). Neither time did anything visibly happen: no error, no confirmation, nothing at all. The only sign anything happened was a '?' getting appended to the URL, which suggests the button is just submitting a plain form rather than running any real validation.

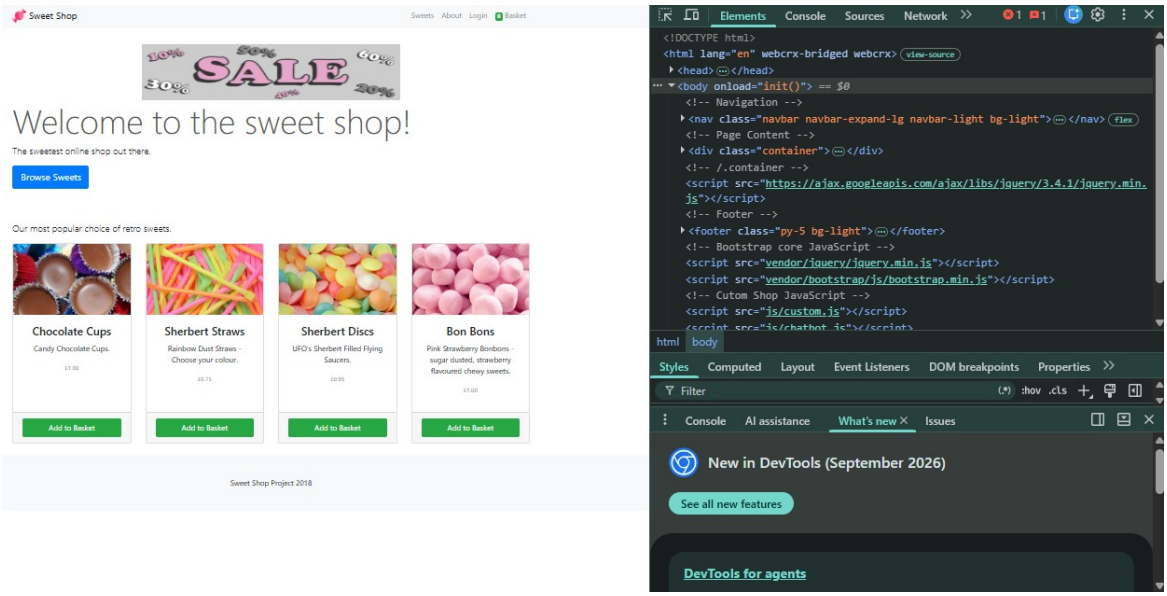

Redeem clicked with an empty code: no message shown, just '?' added to the URL.

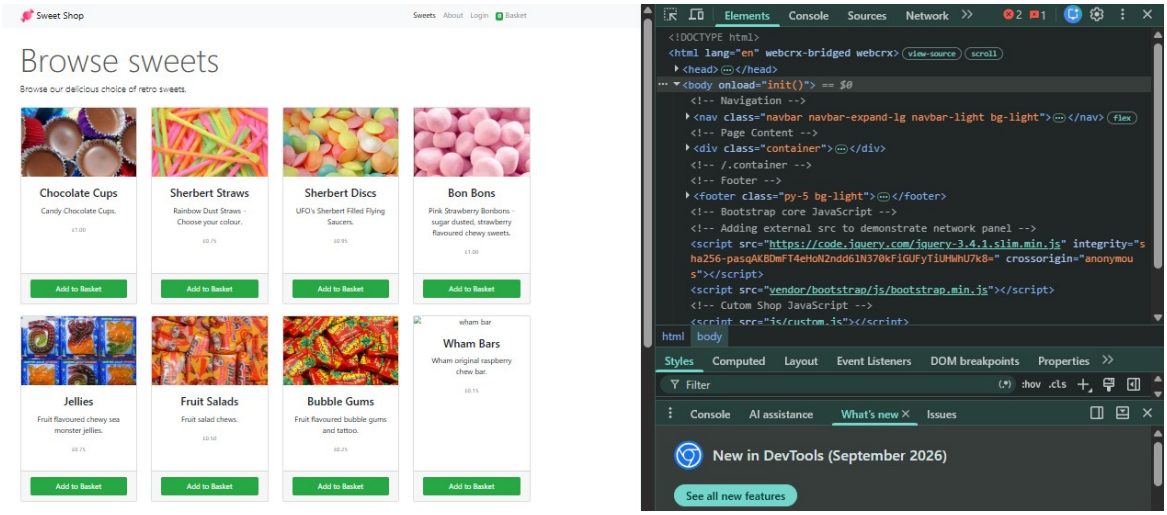

BUG-22: jQuery Gets Loaded Differently on Every Page

Where: Site-wide (Home, About, Sweets) **Severity: Low**

This is more of a code-quality thing than something a regular visitor would notice, but I checked the script tags across a few pages out of curiosity. The Home page loads jQuery twice: once from Google's CDN, once from a local vendor file. The About page loads it once, locally. The Sweets page skips the local file entirely and pulls in a different "slim" build from a separate CDN (there's a code comment there saying it was added on purpose to demonstrate the Network panel, so that particular one may well be intentional).

Home page jQuery loaded twice: Google CDN and local vendor file.

Sweets page: a different, 'slim' jQuery build loaded from a separate CDN.

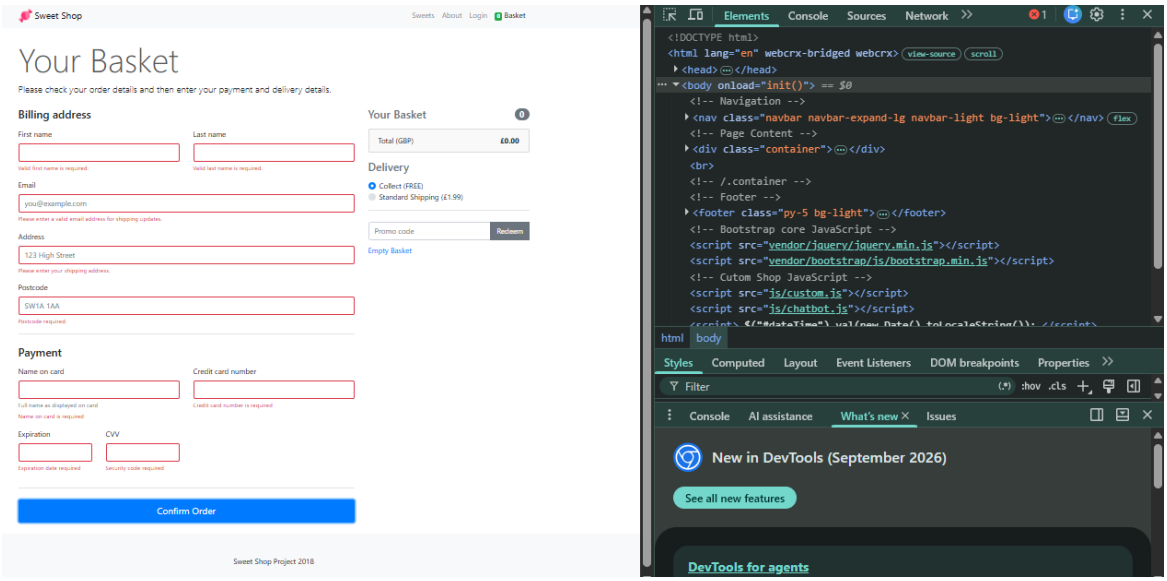

Three different loading setups across one small site isn't great practice on its own, and the slim build specifically is missing some jQuery features (like $.ajax) that the full version includes, so it's worth flagging in case anything downstream depends on those.

Additional Checks Performed

A few things I tested turned out to be working correctly, or turned out to be false alarms on my end once I checked more carefully. Listing them here too, since I think a report that only shows failures is a little one-sided, and a couple of these are worth knowing about if someone else picks up testing this app next.

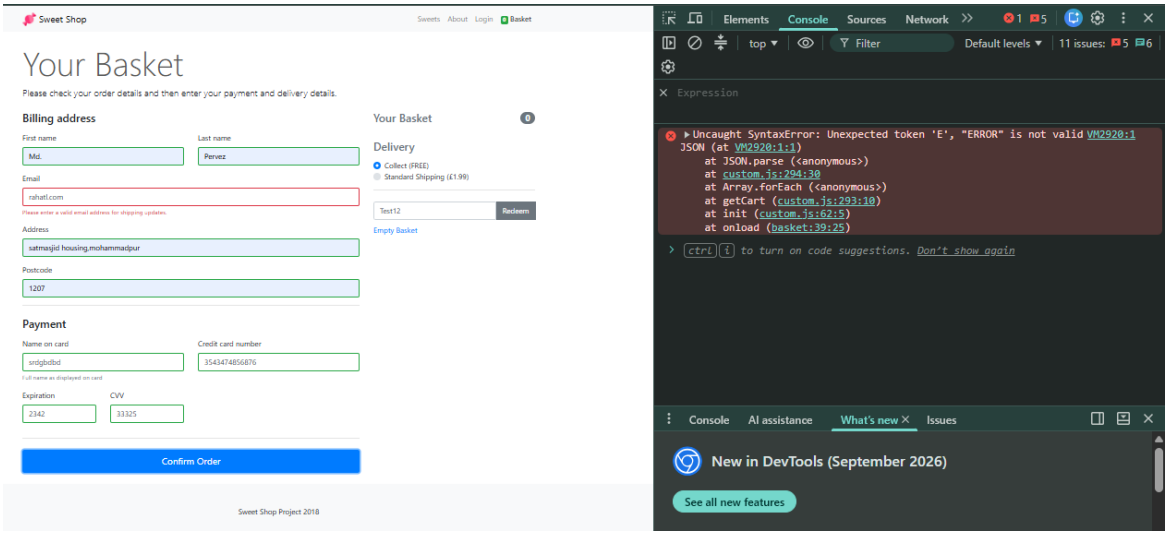

Things that actually work fine

• Submitting the checkout form with every field empty correctly shows a validation message under each required field (First name, Last name, Email, Address, Postcode, and every Payment field).

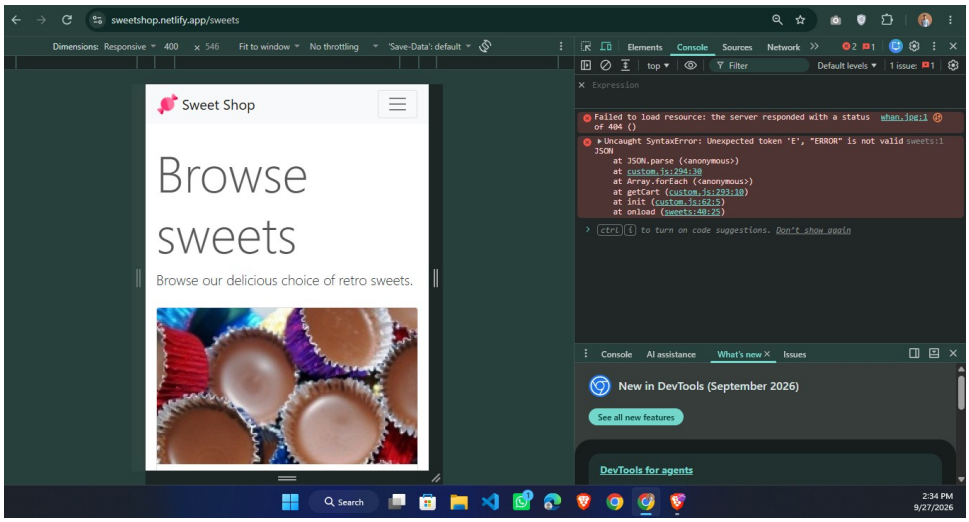

Empty-form submission: every required field is flagged correctly.

• Email format validation works as expected. I entered “rahatl.com” (no @ symbol) with everything else filled in validly, and only the Email field was flagged. Every other field showed as valid.

Only the malformed email is rejected, and every other field passes.

• The site holds up well on mobile. At a 400px viewport width, the navbar collapses into a working hamburger menu, and page content stacks cleanly into a single column with no overlapping or cut-off elements on Sweets, About, or Basket.

400px mobile view: layout stacks cleanly, hamburger menu works.

• The “Empty Basket” link on the Basket page isn't actually dead. My first read of the page source suggested it was just a placeholder link, but clicking it in the browser shows it does trigger a real confirm() dialog and updates the total. I've corrected my own note on this rather than leaving the wrong assumption in.

• A full sweep of the Network tab across every page (Home, Sweets, About, Login, Basket) turned up only the one broken resource site-wide: the Wham Bars image already covered above. Everything else loads cleanly.

Closing Notes

The one theme running through most of the higher-severity issues is validation, or the lack of it. Whether it's a password that's never checked, a basket that's never verified to have items, or payment fields that accept anything at all, the pattern points toward the backend trusting the frontend far more than it should. If I were prioritizing a fix list, I'd start with the cart-data corruption (BUG-07) since it blocks the entire purchase flow, then the login issue (BUG-20) given the security angle, before moving on to the checkout-validation gaps.

Thanks for reading through. I'm happy to walk through any of these in more detail.
